## University Lands Rangeland Seed Mixtures by County

(Updated March 1, 2024)

University Lands (UL) allows only pre-approved seed mixtures to be used when reseeding damaged rangelands. Approved seed mixtures are prescribed relative to the native rangeland on a county-by-county basis. **No substitutions are to be made unless approved by the UL Range Conservationist assigned to the county where reseeding is required. Upon request, UL can provide alternative seed species to replace required seed species that may be unavailable.** Additionally, Pearl or Foxtail Millet can also be added to any of the following seed mixtures, as a filler/nurse plant.

**To promote environmental stewardship and support the lessee's ES&G goals**, University Lands encourages the use of **pollinator friendly seed species** when reseeding rangelands in West Texas. If operators are interested in adding **pollinator friendly seed(s)** to their seed mix, please contact University Lands to receive written approval before reseeding.

**A map of the UL Range Conservationists coverage areas and contact information is included in this document, but can also be found on the UL website at: <http://www.utlands.utsystem.edu/>**

### Seed Supplies:

Some local Soil and Water Conservation District (SWCD) personnel are familiar with UL's reseeding requirements and usually have approved seed mixtures available for sale. **Please note that the county SWCD's typically shares office space with the USDA-Natural Resource Conservation Service (NRCS).**

To buy seed, please call the SWCD office listed for the county where reseeding is required and ask for the University Lands approved seed mixture. Technical assistance may also be obtained from the Natural Resource Conservation Service personnel at the same phone number.

**Preparation of seed bed:**

Leave area to be reseeded somewhat rough. Roughness will allow rain to be trapped on the surface of the seeded area and will allow seedlings a better chance of survival. Pack or firm the seedbed. Establishing native grasses is much different than agricultural crops, as the seedbed must be firm. Once packed, seed can either be Broadcast or drilled per the recommendation of the UL Range Conservationist assigned to the area. Follow up by packing the area again with tires or tracks that will leave a firm seedbed with small depressions to hold moisture.

In sandy soils a mulch or litter may be required to control wind erosion and conserve soil moisture while seedlings are becoming established. Hay, cotton burs, or other suitable material may be used.

**Seed by County:**

The following seed mixture is based on a Pure Live Seed (PLS) basis. Calibration of the seeding rate will be done based on the bulk weight of the seed. Bulk weight and the percentage of PLS can be found on the seed tickets, which are attached to the seed bags. To determine the amount of PLS, multiply the PLS percentage by the bulk weight of the bag. If Pearl or Foxtail Millet are added in the regular mix, add 0.75 lbs. per acre. Information on Pollinator friendly species can be provided upon request. The following seed mixtures are the amount of PLS required per acre for adequate reseeding.
